DETAILED ACTION

Allowable Subject Matter

1. Claims 17-21 and 40-44 are allowed.

Regarding Claim 17, Arnstein, Hall, and Mcfarland do not teach, alone nor in combination, a radar detection circuit coupled to receive the digital low frequency signal, wherein the radar detection circuit further includes:

multiplication circuitry for receiving and squaring a low frequency digital signal;

moving average filter coupled to selectively receive an output signal produced by the multiplication circuitry, the moving average filter producing a moving average filtered signal;

first conversion block for converting a magnitude of the moving average filtered signal into decibel values; and

a threshold comparison state machine coupled to receive an output of the first conversion block in decibel values, the threshold machine for measuring rise time, fall time, and magnitude levels of received signals and detects a received radar pulse pattern and produces a corresponding control signal indicating whether a radar signal has been detected to the baseband processor.

Claim 40 is allowable for similar reasons as claim 17.
